

Component Wise Breakdown

Local AI Model :

Free AI models come at the cost of your data, the models use your data to further train and enhance themselves. Hence, anything done using the Free Models available on Opencode is stored in the cloud.

Ways to overcome data leakage -

1. Having good enough hardware to run real local AI models that don't connect to the cloud but run entirely using your systems resources.
2. Used paid version of AI models which include privacy terms such as not keeping records or using your data for further training.

SSH and Tailscale :

The SSH is a receptor for the computer, the SSH has a port through which it sends signals to your computer. The port is protected by a firewall if you are on a Windows and Mac, make sure to set the firewall up if you are on linux. The firewall will however have exceptions; for example, it may allow a local IP address, a local WIFI or any Tailgate IP address to access the port. To prevent hackers from accessing the port it is best to change the firewall rules. The firewall rules can be changed by asking opencode to make the firewall exceptions such that only the Tailscale IP address of the phone can access the port. This will prevent any other device from accessing the port.

However, there still exists a risk where your Google account may be compromised allowing hackers to join your Tailscale network. To prevent this you can enable the Tailnet lock, this will shift control over devices connected to your Tailscale network from the cloud to the user.

The Setup :

- Run this command on your laptop- “tailscale status”
- Copy the long key starting with “tlnet:...”
- Open the Tailscale app on your phone
- Click on your profile in the top right corner
- Click on Tailnet lock and your “tlnet:...” will be there
- Run this command on the Windows Powershell of your computer -
“tailscale lock init --gen-disablements=3 tlnet:Key_A_Here
tlnet:Key_B_Here”
- Key_A_Here should be the computer's “tlnet:...”
- Key_B_Here should be the phone's “tlnet:...”
- This will give you 3 secret codes which will be of use if something goes wrong with login in the future
- Store the keys offline so nobody can have access to them except you
- Now no new system can login to your network without your approval

The SSH and Tailscale are practically foolproof using these methods. (however no methods are full proof to hacking in the digital age)

Termius :

Termius is a local application which can't be hacked unless your phone is compromised. In such a scenario disconnect Tailscale from your laptop to prevent any harmful use of Termius.

Note : No software is completely safe, make sure to use every software with caution both in this pipeline and in general.
