Structured Breakdown

Local AI model - A local AI model is an AI model that has access to your files and can perform tasks directly on your computer. A local AI can only be run using an interface that connects and gives tools to an AI model to act as local AI. In this pipeline OpenCode is the interface that enables an AI to act locally. The AI model can access folders and create folders locally which helps it store projects and recall projects whenever needed. The AI can also compute at a higher level using your computer's hardware instead of your phone's hardware.

SSH Server - An SSH server exists on your computer, it allows your computer to receive encrypted messages over devices on a network. It acts as the ears for the computer.

Tailscale - It is the network that SSH gets signals from. Tailscale creates a network between connected devices being able to pass encrypted messages through wireguard. It allows devices to be connected no matter where they are in the world.

Termius Shell - This is the SSH client that sends signals to the Computer using another device. It is similar to a remote which controls the Computer which uses SSH to hear the signals.
